Signifies slow/no wake zone  
Bay indications are accurate within several feet. We have erred on the side of slow wake for inconsistent areas.

Main lake shoreline indications are not 100% accurate but a reminder as to just how close 100 feet is in choke points.

*This map is only a guide and you are responsible for maintaining proper speeds according to WI DNR laws and town ordinances.*

The areas noted are slow/no wake zones. A slow/no wake zone is 100 feet from any shoreline or dock. The DNR defines a slow/no wake as the lowest possible speed required to maintain steerage.

For example, in a 22 ft pontoon with a 40 hp motor, that is around 1500 rpm.
